

Air Power:

Ground Unit and Ground Target Data

Alan Watson Forster & Carl Smeaton

11 February 2026

Introduction

For many players, the principal focus of the *Air Power* game is air-to-air combat. That said, no less an authority on air-to-air combat than Robin Olds affirmed:

“You’re not going to win a war by shooting down a damn MiG, you’re going to win a war by bombing the bejesus out of whatever you were sent to bomb.”

This document deals with those “whatevers”: the ground units and ground targets that are subject to air-to-ground attacks and the ground air-defense units that protect them. It first covers ground combat and transport units, then air-defense units (AAA, FCR, SAM, EWR, and CCU units), and finally ground targets. An appendix gives some examples of battalion-sized units.

Much of the data here is adapted from *Air Strike*, *Eagles of the Gulf*, and *The Speed of Heat*, from *Air Power Journal*, and

from Malcolm Pipe’s extensive compendium of AAA and SAM units. However, the data have been carefully revised to improve their accuracy and internal consistency, a wider variety of ground combat units are covered to give a richer experience, and the descriptions of the units and their weapon systems have been expanded.

Ground Combat and Transport Units

Ground combat units are formations of infantry, tanks, IFVs, APCs, or artillery whose primary role is combat with other ground units. Transport units provide strategic mobility to infantry and towed artillery and are the life-blood of logistic networks.

Table 1 summarizes the properties of ground combat and transport units, and Figure 1 shows their representation as counters. All platoons and batteries in Table 1 are also available as sections and squads. AFVs have light, medium, or heavy armor protection. The AAA class is B2 for infantry platoons and B3 for AFV platoons, indicating that they are capable of barrage fire to altitudes of 2 and 3 levels, respectively. Infantry and AFV sections and squads are not capable of barrage fire.

Table 2 gives examples of different types of vehicles. It is extensive but not exhaustive, but nevertheless should serve as guidance for other types of vehicle.

Infantry Units

Infantry are soldiers trained to fight on foot. In some cases, they are also trained to fight from IFVs. Mechanized infantry are transported by APCs or IFVs. Motorized infantry are transported by trucks.

Infantry Platoon. An infantry platoon is armed with small arms, light machine guns, grenade launchers, and portable anti-tank weapons such as bazookas, LAWs, MAWs, RPGs, and portable ATGMs.

Infantry Weapons Platoon. An infantry weapons platoon is equipped with heavier weapons, including medium or heavy machine guns, recoilless rifles, portable ATGMs, and automatic grenade launchers. It is often a battalion-level asset.

Infantry Mortar Platoon. An infantry mortar platoon is equipped with portable 60-mm, 81-mm, 82-mm, or similar mortars. It is often a battalion-level asset.

Infantry FAQ Squad. An infantry FAC squad has a specialized forward air controller with other soldiers providing communication and protection. An infantry FAC squad will often form a composite platoon with an infantry or infantry weapons platoon. If operating independently, it will often be transported by a light truck squad.

Infantry SAM and Heavy SAM Squad. Infantry SAM and heavy SAM squads are equipped with shoulder-launched and pedestal-launched SAMs, respectively, with one launcher per squad. Their SAM capabilities and VP values are given in a subsequent section. An infantry SAM squad will often form a composite platoon with an infantry or infantry weapons platoon. If operating independently, it will often be transported by a light truck squad.

Tank, Anti-Tank, and Reconnaissance Units

Tanks are armored vehicles that are specialized for direct fire with a gun. Here, the gun does not have to be mounted in a turret; tank destroyers with casemate guns such as the SU-100, Kanonenjagdpanzer, and Stridsvagn 103 are also considered to be tanks.

Anti-tank vehicles are armored vehicles equipped with anti-tank guided missiles. Conventional gun-armed tank destroyers are considered to be tanks.

Reconnaissance vehicles are armored vehicles specialized in scouting and observation and with no significant offensive weapons. They are armed only with machine guns. Vehicles used for reconnaissance that do have significant offensive weapons (e.g, 20 mm or larger guns) are typically classified as light tanks.

Heavy Tank Platoon. These have heavy tanks such as those from Table 2.

Medium Tank Platoon. These have medium tanks such as those from Table 2.

Light Tank Platoon. These have light tanks such as those from Table 2.

Open Tank Platoon. These have open tanks such as those from Table 2.

Medium Anti-Tank Platoon. These have medium anti-tank vehicles such as those from Table 2.

Light Anti-Tank Platoon. These have light anti-tank vehicles such as those from Table 2.

Light Reconnaissance Platoon. These have light reconnaissance vehicles such as those from Table 2.

IFV and APC Units

Both IFVs and APCs are armored vehicles that transport infantry. However, IFVs have a 20 mm or larger cannon for fire support, and APCs do not. Some IFVs are also designed to allow their attached infantry to fight while mounted. A mechanized infantry platoon will normally be transported by a platoon of APCs or IFVs.

Medium IFV Platoon. These have medium IFVs such as those from Table 2.

Light IFV Platoon. These have light IFVs such as those from Table 2.

Light APC Platoon. These have light APCs such as those from Table 2.

Open APC Platoon. These are platoons with open APCs from Table 2.

Armored Car and Half-Track Units

Armored cars and armored half-tracks are considered to be light tanks, light anti-tank vehicles, light reconnaissance vehicles, light IFVs, or light or open APCs according to their role and armament.

For example, the AMX-10 RC is considered to be a light tank, the BRDM-2 ATGM variants are considered to be light anti-tank vehicles, the Ferret is considered to be a light reconnaissance vehicle, the LAV-25 is considered to be a light IFV, and the BTR-60 is considered to be a light APC.

HQ Units

These are the HQ platoons of battalions or regiments. Normal platoons serve as the HQ platoons of companies.

Infantry HQ Platoon. An infantry HQ platoon is the HQ unit of an infantry battalion or regiment. The HQ platoon of a mechanized infantry battalion or regiment will consist of an infantry HQ platoon transported by a normal IFV or APC platoon. The HQ platoon of a motorized infantry battalion or regiment will consist of an infantry HQ platoon transported by a normal truck platoon.

Mobile HQ Platoon. A mobile HQ platoon is typically the HQ unit of a battalion or regiment other than those of infantry, tank, mechanized infantry, or armored artillery. It is equipped with trucks, and its personnel are not specialized in fighting as infantry.

Armored HQ Platoon. An armored HQ platoon is the HQ unit of a tank, mechanized infantry, or armored artillery battalion or regiment. It is typically equipped with modified APCs such as the AIFV-B-CP, BMP-1K, BMT-2K, BTR-60P/PA/PB/PBK, FV105 Sultan, M577, M1068, M1130, YP-408 PWCO, and YPR-765 PRCO-C.

Artillery Units

Artillery is specialized in indirect fire. The weapons may be mortars, guns or howitzers, rockets, or missiles and the mounts may be armored, tracked, mobile, or towed.

Armored Mortar Platoon. These have mortars mounted in armored vehicles that provide both mobility and protection for their crew and weapons from small arms and artillery shrapnel. They include platoons with the 81-mm AMX-10P TMC-81, 81-mm FV432, 107-mm M106, 81-mm M125, 120-mm M1064, 120-mm M1129/M1252, and 120-mm VTM 120.

Towed Mortar Platoon. These have mortars on unprotected, towed mounts. They include platoons with the 120-mm M1938, 120-mm M1943, and 160-mm M-160. Smaller infantry mortars are found in infantry mortar platoons.

Armored Artillery Battery. These have guns or howitzers in armored vehicles that provide both mobility and protection for their crew and weapons from small arms and artillery shrapnel. They include batteries with the 130-mm 2S1 Gvozdika, 152-mm 2S3 Akatsiya, 152-mm 2S19 Msta-S, 105-mm Abbot, 155-mm AMX-30 AuF1, 155-mm AS-90, 155-mm M109, and 155-mm Panzerhaubitze 2000.

Tracked Artillery Battery. These have guns or howitzers mounted on tracked vehicles that provide mobility, but do not provide protection from small arms or artillery shrapnel. They include batteries with the 240-mm 2S4 Tyulpan, 203-mm 2S7 Pion, 105-mm M7 Priest, 175-mm M107, and 203-mm M110.

Mobile Artillery Battery. These have guns or howitzers mounted on wheeled vehicles that provide limited mobility, but do not provide protection from small arms or artillery shrapnel. They include batteries with the 155-mm Archer and 155-mm CAESAR.

Towed Artillery Battery. These have guns or howitzers in unprotected, towed mounts. They include batteries with the 152-mm D-20, 130-mm D-30, 122-mm D-74, 155-mm FH70, 105-mm L118 Light Gun, 155-mm M114, 105-mm M119, 155-mm M198, 105-mm OTO Melara Mod 56, and 87.6-mm QF 25-pounder. A truck platoon may transport a towed artillery battery.

Armored Rocket Artillery Battery. These are rocket-armed equivalents of armored artillery batteries. They include batteries with the M270 MLRS and TOS-1.

Mobile Rocket Artillery Battery. These are rocket-armed equivalents of mobile artillery batteries. They include batteries with the BM-21 Grad, BM-30 Smerch, and M142 HIMARS.

Tracked Missile Artillery Battery. These are missile-armed equivalents of tracked artillery batteries. They include batteries with the MGM-52 Lance and Pluton.

Mobile Missile Artillery Battery. These are missile-armed equivalents of mobile artillery batteries. They include batteries with the 9K52 Luna-M (Frog), Corporal, Sergeant, M34/M50 Honest John, M74 Redstone, M790 Pershing 1a, M1003 Pershing II, OTR-21 Tochka (SS-21), and RSD-10 Pioneer (SS-20).

Transport Units

Trucks and tracked carriers are unarmored or incompletely armored vehicles that transport infantry, towed weapons, and supplies, including fuel and ammunition. Trucks are wheeled and have good or poor mobility, whereas tracked carriers have unrestricted mobility.

Truck Platoons. These are platoons with medium and large trucks. A motorized infantry unit will normally be transported by a similarly-sized unit of trucks. A towed artillery battery will normally be transported by a truck platoon.

Light Truck Platoons. These are platoons with light trucks such as the Jeep, GAZ-69, Humvee, Land Rover, or UAZ-469.

Tracked Carrier Platoons. These are platoons with tracked carrier vehicles from Table 2.

AAA Units

AAA units specialize in the use of guns to destroy attacking aircraft, but also have a secondary ground combat capability.

Properties

Table 3 summarizes the properties of AAA units, and Figure 2 shows their representation as counters. All platoons and batteries in Table 3 are also available as sections (but not squads). As well as the properties common to all ground units, Table 3 gives:

- the AAA class (light, medium, or heavy);
- the maximum altitude;
- the limits of short, medium, and long range in hexes;
- the hit rolls at short, medium, and long range;
- the damage rating;
- whether the unit has an all-weather or ranging-only fire-control radar and its frequency band;
- whether it has night infrared sights; and
- whether it is also equipped with a SAM system.

If the unit has a SAM, this will be described in detail in the section on SAM launcher units.

When comparing these properties, remember that towed batteries have six to eight gun mounts, and armored or mobile sections have only two gun mounts.

FCRs

Some AAA units have integrated FCRs that give them an all-weather and night capability. Most medium and heavy can also use add-on FCRs, described below. Units without an FCR (or with a range-only FCR) are limited to visually sighted targets.

Light AAA Units

M2 Platoon. The Browning M2 .50 cal (12.7 mm) heavy machine gun is normally found on a low tripod for ground combat, but here is used on a tall dual-purpose mount suitable for air defense. A platoon has six guns.

The M2 gun was introduced in 1933 and has been used by United States forces and their allies in numerous conflicts since then.

DShK-38 Platoon. The DShK-38 12.7 mm heavy machine gun is most commonly found on a low, wheeled mount for ground combat, but here is used on a tall tripod suitable for air defense. A platoon has six guns.

The DShK-38 entered service with the Soviet Army in 1938 and saw action in World War II and numerous conflicts since then, including the Korean and Vietnam Wars, in which the Soviet Union participated or provided arms.

M16 Section. The M16 Multiple Gun Motor Carriage has an M45 turret with four M2 .50 cal (12.7 mm) heavy machine guns mounted on a modified M3 half-track. A section has two vehicles.

The M16 was used by United States forces during World War II and (primarily as an anti-personnel weapon) in the Korean War for airfield defense. Additionally, Israeli forces employed it during the 1956 Arab-Israeli War.

M55 Platoon. The M55 has an M45 turret with four M2 .50 cal (12.7 mm) heavy machine guns mounted on a towed carriage. A platoon has four gun mounts.

The M55 was used by United States forces during the Korean War and by Pakistani forces during the 1965 India-Pakistan War.

ZPU-1/2/4 Battery. The ZPU-1/2/4 have single, twin, or quad 14.5 mm heavy machine guns in open mounts on towed carriages. A battery has six gun mounts.

The ZPU-1/2/4 was introduced in 1949 and saw extensive service with Soviet or Soviet-supported forces in many subsequent conflicts, including with communist forces in the Korean War and Vietnam War and with Arab forces in the various Arab-Israeli Wars from 1956 onwards.

Mobile ZPU-1/2/4 Section. This is a section of two light trucks mounting ZPU-1/2/4 guns.

Many users of the ZPU-1/2/4 mount it on a suitable truck for increased mobility. Like the towed versions, it has seen combat in many conflicts.

M167 Platoon. The M167 Vulcan Air Defense System (VADS) has a 20 mm six-barreled Vulcan gun in an open mount on a towed carriage. The fire-control system has optical sights and a range-only radar. A platoon has four gun mounts.

The M167 was introduced into service with the US Army in 1967, principally for airfield defense, and subsequently served with other US allies.

M163 Section. The M163 Vulcan Air Defense System (VADS) has a 20 mm six-barreled Vulcan gun in a lightly armored

but open-topped turret on an adapted M113 APC. The fire-control system has optical sights and a range-only radar. A section has two vehicles.

The M163 VADS was introduced into service with the US Army in 1968 and has since been adopted by other US allies. The M163 was used by US forces in the Vietnam War, the 1989 Invasion of Panama, and the 1991 Gulf War. It was also used by the Israel Army in the 1982 Lebanon War and in 2002 during the Second Intifada.

From 1988 in the US Army, each M163 was typically issued with a FIM-92 Stinger launcher with two rounds, so each M163 section effectively carried a mounted FIM-92 section.

TCM-20 Platoon. The TCM-20 is an Israeli adaptation of the M55, with two Hispano-Suiza 20mm guns from obsolete aircraft replacing the four .50 cal machine guns. As with the M55, the fire-control system is entirely optical. A platoon has four gun mounts.

The TCM-20 was employed by Israeli forces from 1970 and subsequently saw combat in the 1973 Arab-Israeli War and the 1982 Lebanon War.

M3 TCM-20 Section. The M3 TCM-20 has a TCM-20 turret mounted in an adapted M3 half-track, like the earlier M16. A section has two vehicles.

The M3 TCM-20 was used by Israeli forces in the 1973 Arab-Israeli War and the 1982 Lebanon War.

Rh-202 Battery. The Rheinmetall Rh-202 has a single or twin 20mm gun in an open mount on a towed carriage. The fire-control system is entirely optical. The most common version is the twin mount. A battery has six gun mounts.

The twin version entered service with West German forces in 1972 and was used for airfield defense. Subsequently, it was exported and notably used by the Argentine Air Force in the 1982 South Atlantic War in the defense of BAM Malvinas (Port Stanley Airport) and BAM Condor (Goose Green Airfield).

Panhard M3 DCA Section. The Panhard M3 DCA vehicles have an armored turret for twin 20 mm guns mounted on the Panhard M3 APC. The guns have optical sights, but typically one vehicle in each section or platoon is equipped with a search-and-ranging radar and can share this information automatically with the others. A section has two vehicles.

The Panhard M3 DCA served with the armed forces of Côte d'Ivoire, Niger, and the UAE.

ZU-23 Battery. The ZU-23 has twin 23 mm cannons in an open mount on a towed carriage. It was designed as a more powerful replacement for the ZPU-1/2/4. The fire-control system is entirely optical. A battery has six gun mounts.

The ZU-23 was introduced into service by the Soviet Army in 1960. It later served with the armed forces of many Soviet allies, including with North Vietnam in the Vietnam War, with Egypt and Syria in the 1967 and 1973 Wars, with Soviet

forces in the Soviet-Afghan War, with Iraq in the Iraq-Iran War, with Syria in the 1982 Lebanon War, and with both sides in the Afghan Civil War.

Mobile ZU-23 Section. This is a section of two light trucks mounting ZU-23 guns.

As with the earlier ZPU-1/2/4, many users of the ZU-23 mount it on vehicles, including trucks, tracked carriers, and APCs, for better mobility.

Sinai 23 Section. The Sinai 23 has a Dassault TA20 turret with two 23 mm guns and six Ayn-al-Saqr (similar to the Strela-2M) or Stinger missiles on an M113 chassis. It has night IR sights. A section has two vehicles. Each battery operates with one vehicle equipped with an RA20S search radar.

The Sinai 23 entered service with the Egyptian Army in 1991.

ZSU-23-4 Section. The ZSU-23-4 has four radar-controlled 23 mm guns, similar to those in the ZU-23, mounted in an armored turret on a hull adapted from the PT-76 light tank. A section has two vehicles.

The ZSU-23-4 entered service in the Soviet Army in 1965, replacing the ZSU-57-2 and outclassing all NATO anti-aircraft guns at that time. A platoon of four was assigned to the air-defense battery of tank and motor-rifle regiments and later complemented by a platoon of four SA-9 vehicles. It was exported to Soviet allies and saw extensive combat with Arab forces in the 1973 Arab-Israeli War and with Iraqi forces in the Iran-Iraq War and the 1991 Gulf War.

LAV-AD Section. The LAV-AD has a 25 mm GAU-12 rotary cannon and eight FIM-92D Stinger missiles mounted in a turret on the LAV-25 vehicle. It does not have radar, but is equipped with a passive night IR sight. A section has two vehicles.

The LAV-AD entered service with the USMC in 1997, but was retired after only a few years.

M53/59 Section. The M53/59 has a twin M53 30 mm gun mount on a partially armored truck. The fire-control system is entirely optical. A section has two vehicles.

The M53/59 entered service in the Czech Army in 1959 and was used instead of the ZSU-57-2. It was also exported to Iraq and saw combat in the Iran-Iraq War and the 1991 Gulf War.

AMX-30SA Section. The AMX-30SA is equipped with a pair of radar-controlled 30 mm Hispano-Suiza guns mounted in an armored turret on the hull of an AMX-30 tank. It is an improved version of the AMX-30 DCA. A section has two vehicles.

The AMX-30SA served only in the Saudi Army from 1979.

Tunguska Section. The Tunguska has twin radar-controlled 30mm guns and four SA-19 missiles in an armored turret on an armored and tracked hull. It was designed to counter

the A-10 and AH-64, against which the earlier ZSU-23-4 had weaknesses. A section has two vehicles.

The Tunguska entered service in the Soviet Army in 1984. It has been used by Russia, Ukraine, and Belarus after the break-up of the Soviet Union and has been exported.

Tunguska-M Section. The Tunguska-M is an improved version of the Tunguska with eight missiles instead of four. A section has two vehicles.

The Tunguska-M entered service in the Soviet Army in 1990. It has been used by Russia, Ukraine, and Belarus after the break-up of the Soviet Union and has been exported.

Medium AAA Units

Oerlikon GDF Battery. The Oerlikon GDF has two 35 mm guns in an open mount on a towed carriage. A battery has six gun mounts. The basic fire-control system is optical, but a section is often coupled with the Super Fledermaus or Skyguard fire-control radars. (These radars cannot control a whole battery, only a section.)

The Oerlikon GDF entered service in 1963 and has served widely. Notably, it saw combat in the South Atlantic War with the Argentine forces in the defense of BAM Malvinas (Port Stanley Airport) and BAM Condor (Goose Green Airfield).

Gepard Section. The Gepard has two radar-controlled 35 mm guns in an armored turret on an adapted Leopard 1 tank hull. A section has two vehicles.

The Gepard entered service in 1976 with the West German Army and also served with the Belgian and Dutch armies. After the end of the Cold War, they were retired by these armies, and many were sold on to other countries.

61-K Battery. The 61-K (M1939) has a single 37 mm gun in an open mount on a towed carriage. The fire-control system is entirely optical, and the 61-K cannot be coupled to an external fire-control radar. A battery has six gun mounts.

After entering service in 1939 with the Soviet Army, it served in WW2 and after until replaced by the S-60 57 mm gun. It also served with many Soviet allies, and in particular with communist forces in the Korean and Vietnam Wars.

The 61-K is referred to as the “M-38” in *Air Strike*, *Eagles of the Gulf*, and *The Speed of Heat*.

Bofors L/60 Battery. The Bofors L/60 has a single 40 mm gun in an open mount on a towed carriage. The fire-control system is entirely optical. A battery has six gun mounts.

It entered service in the 1940s and was widely used by Allied forces during WW2, both on land and sea. After the war, many continued to see service, although it was increasingly inadequate against faster jet aircraft and in many cases was replaced by the new L/70 model.

Bofors L/70 Battery. The Bofors L/70 has a single 40 mm gun in an open mount on a towed carriage. Between the

1930s and the end of WW2, aircraft speed increased substantially, and so the engagement time of the Bofors L/60 became inadequate. The new L/70 fired a lighter shell at a higher velocity and achieved a significant improvement in range and engagement time. The basic fire-control system is optical, but various external fire-control radars can be used with it, including the Super Fledermaus and Flycatcher systems. A battery has six gun mounts.

NATO forces and others adopted it widely starting in 1952.

Bofors L/70 BOFI and BOFI-R Battery. The BOFI version of the Bofors L/70 adds modern sights, a laser rangefinder, and proximity-fuzed shells. The BOFI-R version also adds an integrated fire-control radar. A battery has six gun mounts.

The BOFI is used by the armed forces of Brazil.

S-60 Battery. The S-60 is a Soviet single 57 mm gun on an open mount on a towed carriage. The basic fire-control system is optical, but the gun is often used with the SON-9 (Fire Can) radar. A battery has six gun mounts.

It entered service in 1950 with Soviet forces as a replacement for the 61-K 37 mm gun. It was exported to many Soviet allies and saw combat with Arab forces in the 1967 and 1973 Arab-Israeli War, with communist forces in the Vietnam War, and with Iraqi forces in the Iran-Iraq War and the Gulf War. However, it was not used by communist forces in the Korean War. When paired with the SON-9 (Fire Can) radar, it was considered one of the more dangerous AAA systems faced by US aircraft in Vietnam.

ZSU-57-2 Section. The ZSU-57-2 has two 57 mm cannons in a lightly armored but open-topped turret on an armored and tracked hull. The cannons are similar to the S-60 cannons. The fire-control system is optical. A section has two vehicles.

The ZSU-57-2 entered service in the Soviet Army in 1955 and replaced the BTR-40A and BTR-152A self-propelled 14.5 mm AA guns in the AA batteries of tank regiments. It was in turn replaced by the ZSU-23-4 from 1965. The ZSU-57-2 also served widely with Soviet allies and saw combat with Egypt and Syria in the 1967 and 1973 Wars, with Syria in the 1982 Lebanon War, with North Vietnam in the 1972 Easter Offensive and the 1975 Spring Offensive, and with various factions in the Yugoslav Wars in the 1990s.

Heavy AAA Units

KS-12 Battery. The KS-12 (M1939 52-K) and the very similar KS-12A (M1944 KS-1) have a single 85 mm gun in an open mount on a towed carriage. The fire-control system is optical, but the guns are often paired with the SON-9 (Fire Can) radar. A battery has six gun mounts.

It entered service with Soviet forces in 1939. After WW2, it began to be replaced in Soviet service by the KS-19 100 mm and KS-30 130 mm guns, but was widely used by Soviet allies and saw combat with communist forces in the Korean War and the Vietnam War.

KS-19 Battery. The KS-19 has a single 100 mm gun in an open mount on a towed carriage. The fire-control system is optical, but like other contemporary Soviet guns, it was often paired with the SON-9 (Fire Can) radar. A battery has six gun mounts.

It entered service in 1948 with Soviet forces as a replacement for the KS-12 85 mm gun. It also served with many Soviet allies and saw combat with communist forces in the Korean War and Vietnam War and Iraqi forces in the Iran-Iraq and Gulf Wars.

^a Platoons and batteries are available as sections with corresponding modifications to their damage resiliences and hit rolls.

FCR Units

Most medium and heavy AAA batteries can be associated with an add-on fire-control radar (FCR), which improves their accuracy and allows them to engage unsighted targets at night and in adverse weather.

Properties

Table 4 summarizes the properties of FCR units, and Figure 3 shows their representation. In addition to the properties common to other ground units, Table 4 gives:

- the FCR class;
- the frequency band; and
- its modifier to the hit roll.

Specific FCRs

SON-9. The Soviet SON-9 (Fire Can) FCR-A was derived from the earlier SON-4, which in turn was derived from the US-supplied SCR-584. It is commonly used with 57 mm S-60, 85 mm KS-12, 100 mm KS-19, and 130 mm KS-30 batteries.

The SON-9 entered service in 1955 with Soviet forces and was widely exported to Soviet allies. It has seen combat, including with North Vietnam in the Vietnam War, Egypt and Syria in the 1967 War, the War of Attrition, and the 1973 War.

Super Fledermaus. The Contraves Super Fledermaus FCR-C can be used to control a section of two Oerlikon GDF 35 mm guns.

It entered service in 1965 with the Swiss Air Force and also was used by the Argentine Air Force, Brazil, Iran, Japan, and South Africa. It saw combat in the 1982 South Atlantic War in the defense of BAM Malvinas (Port Stanley Airport).

Flycatcher. The Signaal Flycatcher FCR-C can control three to six Bofors L/60 or L/70 guns or SAM launchers.

Flycatcher entered service with the Royal Netherlands Air Force in 1979. It subsequently served with the Indian Armed Forces from 1985, the Irish Defense Forces from 2003, the

Royal Netherlands Army from 1987, the Thai Armed Forces from 1981, Turkey, and Venezuela.

Skyguard. The Contraves Skyguard FCR-D can control two Oerlikon GDF 35 mm guns and additionally a SAM launcher with AIM-9 Sparrow, RIM-9 Sea Sparrow, or Aspide missiles.

Skyguard entered service in 1977 with the Swiss Air Force. It was subsequently very widely exported and used by the Argentine Army, Austria, Bahrain, Bangladesh, Brazil, Canada, Chile, China, Cyprus, Egypt, Greece, Indonesia, Iran, Italy, South Korea, Kuwait, Malaysia, Oman, Pakistan, Saudi Arabia, Spain, Taiwan, and the UK. It saw combat with the Argentine Army in the 1982 South Atlantic War in the defense of BAM Malvinas (Port Stanley Airport) and BAM Condor (Goose Green Airfield).

Figure 3: Air-Defense Units: FCR, EWR, and CCU Units

Type	Size	Defense Strength		Sighting Range	Mobility	VPs		Class	FCR	
						3D	2D/D		Frequency	Modifier
Towed FCR-A	Platoon	2	12	T		6	4/2	A	LF	-1
Towed FCR-B	Platoon	2	12	T		6	4/2	B	MF	-2
Towed FCR-C	Platoon	2	12	T		7	5/2	C	VF	-2
Towed FCR-D	Platoon	2	12	T		8	5/3	D	MW	-3

SAM Units

SAM launcher units are specialized in the destruction of attacking aircraft with surface-to-air missiles.

Properties

Table 5 summarizes the properties of infantry SAM units, and Figure 5 shows their representation as counters. In addition to the properties shared by all ground units, Table 5 gives:

- the number of ready, volley, and reload missiles;
- the multi-target capability;
- whether the unit has quick-reaction capability;
- whether the unit has IFF capability;
- whether the unit has night IR sights; and
- the optical lock-on number and range.

Missile Properties

Table 7 summarizes the properties of the actual missiles:

- guidance mode;
- launch roll;
- turn rate;
- flight time;
- visibility;
- ECCM, chaff, and flare ratings;
- whether the missile is active homing (AH) or has a home-on-jam (HOJ) capability;
- boost phase in FPs;
- base speed and sustainer duration in game turns;
- minimum altitude (and modifier for targets at T level);
- hit rolls for direct and proximity hits; and
- damage ratings for direct and proximity hits.

Infantry SAM Units

Infantry SAM units are squads of infantry specialized in the destruction of attacking aircraft with portable SAMs. Each squad has one launcher and, unless otherwise specified, one ready missile and two reload missiles.

Infantry SAM squads may be attached to infantry, infantry weapons, or infantry HQ platoons.

Most infantry SAMs do not have true proximity fuzes. Thus, proximity hits in the game correspond to glancing direct hits in reality.

SA-7A/B Squad. The 9K32 Strela-2 (SA-7A Grail) was the first Soviet portable SAM. It has a rear-aspect, uncooled IR seeker.

The 9K32M Strela-2M (SA-7B Grail) is similar, but uses a rear-aspect, electrically-cooled IR seeker. In Warsaw Pact

armies, the Strela-2M was sometimes used with the PRP portable RWR receiver that was capable of passively identifying enemy aircraft by their radar emissions.

The Strela-2 and -2M entered service with Soviet forces in 1968 and 1970. They have seen combat in almost every conflict since 1970 in which the Soviet Union or its successor states have been participants or supporters. In particular, the Strela-2M was used heavily by North Vietnamese forces in the 1973 Easter Offensive, by Arab forces in the 1973 Yom Kippur War, by Angolan forces in the South African Border War, by the Afghan Mujahedeen in the Soviet-Afghan War (having been supplied by the CIA), by Iran in the Iran-Iraq War in the 1980s, and by Serbian and Serbian-supported forces in the Yugoslav Wars in the 1990s.

SA-14 Squad. The 9K34 Strela-3 (SA-14 Gremlin) is a development of the earlier Strela-2M. It has a rear-aspect, cryogen-cooled IR seeker. In Warsaw Pact armies, the Strela-3 was sometimes used with the PRP portable RWR receiver that was capable of passively identifying enemy aircraft by their radar emissions.

The Strela-3 entered service with the Soviet Army in 1974. It has seen combat in many conflicts since then in which the Soviet Union or its successor states have been participants or supporters. In particular, it was used by Iraqi forces in the 1991 Gulf War.

SA-16/18 Squad. 9K310 Igla-1 (SA-16 Gimlet) and 9K38 Igla (SA-18 Grouse) use very similar missiles and launchers, but the Igla-1 has a single-channel IR seeker similar to the SA-14, and the Igla uses a dual-channel IR seeker to reduce its susceptibility to flares. The warhead was similar to the SA-7/14, but also exploded any remaining rocket fuel. In the game, this is simulated by increasing the damage rating by one if the missile attacks before expending more than half of

its FPs (round down). Both incorporate IFF interrogators, but these were only used in Warsaw Pact armies.

The Igla-1 entered service with the Soviet Army in 1981 and the Igla in 1983. Both have been widely exported and have seen combat in many conflicts since then in which the Soviet Union or its successor states have been participants or supporters. The Igla was used by Iraqi forces in the 1991 Gulf War, by the Peruvian Army in the 1995 Cenepa War, and by Serbian forces in the 1999 Kosovo War.

FIM-43C Squad. The FIM-43C Redeye Block III was the first US infantry SAM to reach production and enter service. It has a rear-aspect, cryogen-cooled IR seeker.

The FIM-43C entered service with the US Army in 1968 and subsequently was used by Australia, Chad, Denmark, West Germany, Greece, Israel, Jordan, Saudi Arabia, Somalia, Sudan, Sweden, and Turkey. It was also supplied by the CIA to the Afghan Mujahedeen and the Nicaraguan Contras.

FIM-92A/B/C/D Squad. The FIM-92A Stinger has an all-angle, second-generation, cryogen-cooled IR seeker. Its warhead weight 3 kg and was significantly more lethal than in earlier missiles. The FIM-92B Stinger POST adds a UV seeker to distinguish flares from aircraft. The FIM-92C/D Stinger RMP have software updates to further improve the performance against flares. All have an IFF interrogator to help avoid fratricide.

The FIM-92A entered service with the US Army in 1981, the FIM-92B in 1986, the FIM-92C in 1989, and the FIM-92D in 1992. They were exported to dozens of US allies including the Afghan Mujahedeen and the Angolan UNITA. They saw service in the 1982 South Atlantic War, the Soviet-Afghan War, the Angolan Civil War, the Libyan Invasion of Chad, the Tajik Civil War, the Chechen War, the Sri Lankan Civil War, the Syrian Civil War, and the Russian Invasion of Ukraine.

Blowpipe Squad. Blowpipe is an MCLOS optically-guided missile. While in theory this gave it an all-aspect capability, in practice guiding the missile to the target in combat proved to be very difficult.

Blowpipe entered service with the British Army and Royal Marines in 1975. It was also used by the Argentine Army, Canadian Army, Chilean Army and Navy, Ecuadorean Army, Guatemalan Army, Portuguese Army, Malawian Army, Malaysian Army, Nigerian Army, Omani Army, Royal Thai Air Force and Army, and the UAE Army. It saw combat in the 1982 South Atlantic War with both sides and had a low success rate. In 1986, it was trialed by the Afghan Mujahedeen, but again was not considered to be effective. Finally, it was also used in the 1995 Cenepa War by Ecuador.

Javelin/Starburst Squad. Given the poor performance of Blowpipe in the 1982 South Atlantic War, Javelin was quickly developed as an upgraded version of Blowpipe with SACLOS guidance in place of MCLOS guidance. Starburst then replaced the radio-link with laser guidance. Javelin is

also called “Javelin GL” and Starburst was originally called “Javelin S15”.

Javelin replaced Blowpipe in the British Army and Royal Marines in 1984. It was also used by the Botswana Army, the Canadian Army, the Malaysian Army, the Peruvian Army, and the South Korean Army.

Starburst in turn replaced Javelin in the British Army and Royal Marines in 1989. It was also used by the Canadian Army, the Malaysian Army, the Qatari Army, and the Royal Thai Army. Starburst served with the British Army in the 1991 Gulf War, but was not used in combat.

Starstreak Squad. Starstreak is a high-speed laser-guided missile. As the missile approaches the target, it launches three independent explosive darts. The darts have contact fuzes, but not proximity fuzes.

Starstreak replaced Javelin in the British Army and Royal Marines in 2000 and is also used by the South African Army and the Armed Forces of Ukraine. Starstreak served with the British Army in the 2003 Invasion of Iraq, but was not used in combat. It has seen combat in the Russian Invasion of Ukraine.

Starstreak LML Squad. The Starstreak Light Multiple Launcher (LML) has three ready-to-fire Starstreak missiles on a pedestal mount with a single sighting unit. The launcher and its associated equipment are heavy and will normally be transported by a vehicle unit.

Starstreak LML entered service with the British Army and Royal Marines in 2000. It is also used by Indonesia, Malaysia, and South Africa.

Mistral Squad. The Mistral is a French IR-homing missile on a pedestal mount. The missile has a considerably larger warhead than either the Stinger or Igla missiles, but this comes at a cost in portability. The launcher and its associated equipment are heavy and will normally be transported by a vehicle unit.

The Mistral entered service with the French Army in 1990. It was subsequently exported to many other countries.

RBS 70 Squad. The RBS 70 is a Swedish laser-guided missile on a pedestal mount. The launcher and its associated equipment are heavy and will normally be transported by a vehicle unit.

The RBS 70 entered service with the Swedish Army in 1977. It was subsequently used by Argentina, Australia, Bahrain, Brazil, the Czech Republic, Iran, Ireland, Lithuania, Norway, Pakistan, Singapore, Thailand, Tunisia, the UAE, Ukraine, and Venezuela.

Ayn-al-Saqr Squad. The Ayn-al-Saqr (“Eye of the Hawk”) missile is a licensed version of the 9M32M Strela-2m (SA-7B Grail) manufactured in Egypt. It equips one version of the Sinai 23 air-defense vehicle.

It entered service with the Egyptian Army in 1984.

Vehicular and Towed SAM Units

Echelon. The size of a SAM launcher unit is squad, section, or platoon according to its damage resilience (1D, 2D, or 3D, respectively). This does not always coincide with the actual designations used historically. For example, the SA-2 battery in the game corresponds to a battalion in reality.

Nuclear Warheads. The SA-2E has the option of a nuclear warhead.

Soviet and Russian SAM Launcher Units

SA-2B/C/E/F Battery. This is an S-75 (SA-2 Guideline) battery of six single launchers for the long-range V-750 missile and their associated P-12 (Spoon Rest) EWR and SNR-75 (Fan Song) TTR. The variants are the S-75 Desna (SA-2B), S-75M Volkhov (SA-2C), S-75AK (SA-2E), and S-75SM (SA-2F). All are radar-guided, but the SA-2F also has an optical backup.

The S-75 Dvina (SA-2A) system was deployed by the Soviet PVO in 1957. In addition to serving as a key part of the air-defense system of the Soviet Union (and its notable role in ending reconnaissance overflights by shooting down the U-2 of Gary Powers) and its allies, it saw combat in Cuba in 1962, with North Vietnamese forces from 1965, with Indian forces in the 1965 war with Pakistan, and with Egyptian and Syrian forces from 1967.

SA-3B Battery. This is an S-125 Neva (SA-3B Goa) battery with four quad launchers for the 5V24 missile and their associated P-15 (Flat Face) EWR and SNR-125 (Low Blow) TTR.

It saw combat with Egyptian and Syrian forces from 1970.

Mobile SA-3B Battery. This is a mobile S-125 Neva (SA-3B Goa) battery with four twin launchers for the 5V24 missile on trucks and their associated P-15 (Flat Face) EWR and SNR-125 (Low Blow) TTR.

It saw combat with Egyptian and Syrian forces from 1970 and with Iraqi forces in the Iran-Iraq War, the Gulf War, and the Invasion of Iraq.

SA-4A/B Battery. This is an armored 2K11 Krug (SA-4A/B Ganef) battery with three launcher vehicles each with two long-range 9M8M1/9M8M2 missiles and their associated P-40 (Long Track) EWR and 1S32 (Pat Hand) TTR.

It saw combat with Egyptian and Syrian forces from 1970 and with Iraqi forces in the Iran-Iraq War, the Gulf War, and the Invasion of Iraq.

SA-6A/B Battery. This is an armored 2K12 Kub (SA-6A/B Gainful) battery with four launcher vehicles, each with three medium-range 2K12 Kub (SA-6A) or 3M9M3 (SA-6B) missiles and their associated P-40 (Long Track) EWR and 1S32 (Pat Hand) TTR.

It saw combat with Egyptian and Syrian forces from 1970 and with Iraqi forces in the Iran-Iraq War, the Gulf War, and the Invasion of Iraq.

SA-8A/B Squad. This is a squad with a single 9K33 Osa or 9K33M Osa-AK (SA-8A/B Gecko) vehicle with integrated 1S51M3 (Land Roll) TTR. The SA-8A carries four 9M33 missiles, and the SA-8B carries six 9M33M missiles.

The Osa has been widely exported and seen combat with Syrian forces in the 1982 Lebanon War, with Cuban forces in the South African Border War, with Iraqi forces in the 1990 Gulf War, and in more recent conflicts.

SA-9A/B Squad. This is a squad with a single 9K21 Strela-1 or 9K21M Strela-1M (SA-9A/B Gaskin) vehicle with four 9M21 or 9M21M missiles. In the Soviet army, a platoon of four was assigned to the air-defense battery of tank and motor-rifle regiments, complementing the ZSU-23-4.

The Strela-1 has been widely exported and saw combat in the South African Border War, the Iran-Iraq War, the Lebanon War, the Gulf War, the Kosovo War, and the Invasion of Iraq.

SA-11 Squad. This is a squad with a single 9K37 Buk (SA-11 Gadfly) vehicle with four 9M37 missiles and an integrated 9S35 (Fire Dome) TTR. Three squads make up a battery, and three batteries make up a battalion. Normally, one armored 9S18 (Tube Arm) or 9S18M1 (Snow Drift) EWR is allocated to each battalion.

The SA-11 has seen combat in the War in Abkhazia, the Russo-Ukrainian War, and during the Syrian Civil War.

SA-13 Squad. This is a single 9K35 Strela-10 (SA-13 Gopher) vehicle with four infra-red homing 9M37 missiles. Four squads form a platoon. It began to replace the SA-9B in the air-defense platoons of tank and motor-rifle regiments in the Soviet Army starting in 1976 and was subsequently widely exported to Soviet allies. Compared to the earlier system, the missile offers greater lethality, and the vehicle greater protection and mobility (although it is not amphibious). Some are equipped with 9S16 (Flat Box-B) RWR.

The SA-13 saw combat in the South African Border War with Angolan forces, the Gulf War with Iraqi forces, and in the Kosovo War with Serbian forces.

US SAM Launcher Units

M48 Squad. This is a single M48 Chaparral vehicle with four adapted Sidewinder infrared-homing missiles. It was developed after the ambitious Mauler SAM program was abandoned and introduced in 1969. Night IR sights were added in 1984 to give it a limited night capability. The MIM-72A was the original missile based on the AIM-9D. The MIM-72C added an improved seeker and warhead, and the MIM-72E/F added a smokeless motor. The final MIM-72G added a seeker based on that of the FIM-92B Stinger, with much improved rejection of infrared countermeasures.

Figure 4: SAM Launcher Units

I-HAWK Platoon. This consists of three triple launchers for the MIM-23A/C/D missile, plus supporting radars and command elements. The MIM-23B Improved HAWK and its associated improved radars were developed from the original HAWK MIM-23A to give much improved performance at low levels. The MIM-23C has improved ECCM, and the MIM-23D adds a home-on-jam capability. Two platoons with an EWR make up a battery.

The I-HAWK was deployed by the US Army, US Marines, and many US allies.

MIM-104 Battery. An MIM-104 Patriot battery consists of six launchers with associated radar and command elements. The MIM-104A uses the “Standard” missile and was capable only of defense against aircraft. Patriot is used by the US Army and numerous US allies.

EWR and CCU Units

An early-warning radar (EWR) can detect aircraft at longer ranges than the target acquisition radars typically associated with SAM units. It can then pass this information down to SAMs in their integrated air-defense system, sometimes with the intermediation of a CCU, to improve the chance of a target acquisition and lock-on.

A command-and-control unit (CCU) acts to coordinate multiple independent SAM firing units in an integrated air-defense system. For early SAMs, where each battery can engage one target, CCUs are typically at the regimental level (i.e., the formation above the battery). For later SAMs, where each launcher can engage one or more targets, they are typically at the battery level.

Figure 3 shows the representation of EWR and CCU units as counters, and Table 8 summarizes their properties.

Properties. In addition to the properties common to other ground units, Table 8 gives: the EWR class, its frequency band, and its range in mega-hexes.

EWR-A.

EWR-B.

Mobile CCU.

Armored CCU.

Crotale CCU/EWR. This is the HQ and EWR vehicle of a Crotale SAM battery. It is equipped with a Mirador IV radar.

Ground Targets

A ground *target* is a unit of infrastructure such as a bridge and a building.

Properties and Representation

Ground targets are listed with their properties in Table 9.

All ground targets have these properties:

- defense strength;
- defense strength and target class;
- sighting range in hexes; and
- the VPs awarded for 3D/2D/D damage.

All ground targets have a damage resilience of 3D. That is, they are killed when they suffer 3D or more damage.

Some ground targets are represented by counters, and others are represented by features on the maps. Figure 6 shows the graphical representation of the counters, which mainly uses adapted NATO symbols.

Notes on Specific Targets

Aircraft. No VP values are given for transport or fighter airplanes or helicopters, since these can vary significantly with the capacity of the aircraft. A scenario must specify the VP values. As a guideline, they will often be similar to the VP values of the attacking aircraft.

Bridges. Unless otherwise indicated in a scenario, a major bridge is one that extends over two or more hexes, a minor bridge is one that is confined to a single hex, and a small bridge is where a road crosses a river without a bridge being marked on the map.

Penetrating Bombs. When attacking a bunker entrance, a tunnel entrance hex, or a shelter, the attack strength of a penetrating bomb is doubled.

Figure 6: Ground Targets

Example Orders of Battle

This appendix contains a number of example orders of battle and their correspondence in game units.

- Table 10: 2 Para Battalion at the 1982 Battle of Goose Green. At this time, the battalion had attached half a battery of 105 mm Light Guns from Alma Battery of 29 Commando Regiment, RA, a section of Blowpipes from 43rd Air Defence Battery, RA, and a Recce Troop of 59 Independent Commando Squadron, RE.
- Table 11: 12th Infantry Regiment at the 1982 Battle of Goose Green, with attachments from the 25th Infantry Regiment, 4th Airborne Artillery Regiment, 601st Anti-Aircraft Artillery Group.
- Tables 12, 13, 14, 15, and 16: An armored regiment, APC infantry battalion, infantry battalion, field artillery regiment, and heavy artillery regiment of the British Army from about 1960. In the British Army, regiments are battalion-sized units.
- Table 17: An armored regiment of the British Army from about 1985.

Element	Game Ground Unit	Notes
1 × Regimental HQ	1 × mobile HQ platoon	
2 × Batteries (A/B) each:	1 × mobile rocket section	2 × Honest John
2 × Batteries (C/D) each:	1 × towed artillery battery	4 × 8-inch Gun M1
	1 × truck platoon	

Table 17: British Army Armored Regiment (Mid 1980s)

Element	Game Ground Unit	Notes
1 × Regimental HQ	1 × armored HQ platoon	
1 × Reconnaissance Troop	2 × light tank platoon	8 × Scorpion
1 × ATGW Troop	3 × light anti-tank platoon	9 × FV438
3 × Tank Squadrons (A/B/C) each:	4 × heavy tank platoon	14 × Chieftain

Ground Unit Rules

A ground *unit* is a combat or logistics formation of infantry, armor, transports, AAA, SAM launchers, or radars. This section discusses them in general.

All ground units have these common properties which together determine their visibility to aircraft, their vulnerability to air-to-ground and ground-to-ground attacks, their capacity for ground-to-ground attacks, their ability to move through difficult terrain, and value in VPs:

- basic type (e.g., infantry or tanks);
- size;
- damage resilience;
- defense strength and target class;
- mobility;
- sighting range in hexes;
- the VPs awarded for 3D/2D/D damage.

Many units also have properties related to their air-defense capabilities.

Size

A ground unit can be a squad, section, platoon, or battery according to its number of soldiers, vehicles, guns, or launchers. Typically:

- A squad has five to ten soldiers and/or one vehicle, gun, or launcher;
- A section has ten to twenty soldiers and/or two vehicles, guns, or launchers; and
- A platoon or battery has thirty to fifty soldiers and/or three to six vehicles, guns, or launchers.

The term “platoon” is more commonly used for infantry and tank units and “battery” for artillery and air-defense units, but within the game they are equivalent.

Companies, battalions, and other larger units exist above platoons or batteries, but they are represented by multiple units. For example, an infantry company might be formed by three infantry platoons.

Most of the ground units described here and employed in the game are platoons or batteries. Many are also available as squads or sections:

- All ground combat and transport platoon are also available as sections and squads.
- All AAA platoons and batteries are also available as sections.

A section or squad is identical in every way to a platoon or battery that has taken 1D or 2D damage, respectively, except that no VPs are awarded for this notional damage and non-AAA squads and sections may not engage in barrage fire.

Other terms are used for units even within English-speaking

armies. For example, in the US Armored Cavalry, a troop is equivalent to a company and a squadron is equivalent to a battalion. However, in British Army and many Commonwealth armies, a squadron is the equivalent of a company and a troop is equivalent to a platoon. Sometimes a regiment is equivalent to a battalion and other times to a brigade. Nevertheless, the terms squad, section, platoon, and battery are used uniformly here.

Damage Resilience

A ground unit has a damage resilience, which is the amount of damage it can suffer before being killed. It is determined by the size of the unit:

- A squad has a damage resilience of 1D;
- A section has a damage resilience of 2D; and
- A platoon or battery has a damage resilience of 3D.

Defense Strength and Target Class

A ground unit has a numerical defense strength and target class, which are used to calculate the odds of an air-to-ground attack and in ground-to-ground combat.

A ground unit can be a hard, open, or soft target according to the degree to which it provides armored protection to its personnel and weapons:

- A hard target has armored protection both from side and top attacks and is denoted by an underlined defense strength. Most tanks, IFVs, and APCs are hard targets. Hard targets are classified as heavy, medium, or light according to its degree of protection.
- An open target has armored protection from side attacks but not from top attacks and is denoted by an underlined defense strength followed by an exclamation point. It is normally treated as a hard target, but against napalm, fire, FAE, and air-burst HE bombs, it is considered to be a soft target. The BTR-50P APC and the M3 half-tracked APC are examples of open targets.
- A soft target does not have armored protection and does not have an underlined defense strength. Examples include infantry, towed artillery, unarmored vehicles, and armored vehicles that do not fully protect their personnel and weapons such as the M-107 and M-110 tracked artillery vehicles.

Representation

Figures 1, 2, 3, and 5 show the graphical representation of ground units as counters.

The representation is based on NATO symbols, including those for infantry, armor, anti-armor, air defense, guns, missiles, mortar, tube artillery, and rocket artillery. One addition

is that a rectangle denotes an unarmored vehicle such as a truck or tracked carrier. A truck or mobile unit has two wheel symbols in the lower position, whereas a tracked carrier has a tracked symbol. The mortar symbol is modified to be simply an open circle, for compactness.

All vehicular units have either an armored or unarmored vehicle symbol, all infantry units have an infantry symbol, and towed units have none of these.

The letter T in the central position indicates a transport capacity (e.g., APCs, IFVs, cargo trucks, and tracked cargo carriers). Words and letters in the lower position indicate variants on a basic type: the letters H, M, L, and O on an armored unit indicate heavy, medium, light, and open armored protection; the word WPN or FAC on an infantry unit indicates a weapons or FAC unit; and the letter H on an infantry SAM unit indicates a heavy version of the launcher (e.g., the LML version of Starstreak).

The size of a unit is indicated by one, two, or three dots (for squads, sections, or platoons) or one vertical bar (for batteries) in an upper position.

Mobility

A ground unit has a mobility that may restrict the hexes it may occupy according to the terrain in and around those hexes. Infantry units, armored units (whether tracked and wheeled), and tracked units have unrestricted (U) mobility. Truck and mobile (i.e., truck-borne) units have good (G) or poor (P) mobility. All other units have towed (T) mobility.

A scenario may modify the mobility classes of ground units and the associated restrictions. One common modification is to explicitly indicate the hexes occupied by each ground unit; in this case this rule is largely superfluous.

Basic Rule. A ground unit may occupy hexes as follows:

- A unit with unrestricted mobility may occupy: any urban hex; any clear hex; or any forest hex.
- A unit with good, poor, or towed mobility may occupy: any urban hex; any clear hex; or any forest hex with a road or trail.

The basic rules do not distinguish between good, poor, and towed mobility.

Advanced Rule. The following restrictions supersede those in the basic rules:

- A unit with unrestricted mobility may occupy: any urban hex; any clear hex; or any forest hex.
- A unit with good mobility may occupy: any urban hex; any clear hex; or any forest hex with a road or trail.
- A unit with poor mobility may occupy: any urban hex; any clear or forest hex with a road, trail, or runway; or any clear hex adjacent to an urban hex or another clear hex with a road, trail, or runway.

Figure 7: Mobility. The figure shows the hexes a ground unit may occupy according to its mobility under the advanced rule. A ground unit with poor mobility may only occupy the hexes marked with green dots; one with good mobility may occupy those marked with yellow or green dots; and one with unlimited mobility may occupy those marked with red, yellow, or green dots. No ground unit may occupy the hex marked with a black dot.

- A unit with towed mobility may occupy hexes according to the mobility of its transport.

Figure 7 illustrates these rules.

When this advanced rule is used, a scenario must specify (or the players must agree) whether truck and mobile units have good or poor mobility, according to the terrain and the capabilities of the trucks represented, and explicitly or implicitly assign transport units to towed units.

For example, a scenario set in the open desert of southern Iraq might specify that trucks have good mobility, but one set in the Falkland Islands might specify that they have poor mobility. Similarly, a scenario might specify that cargo trucks have poor mobility, but mobile artillery units have good mobility. Finally, a scenario might not assign an explicit transport unit to a towed artillery battery, but might state that it has been transported by helicopter and so can be placed as if it had a transport unit with good mobility.

Transportation

Certain ground units and targets may be *transported* by certain *transport* units.

An infantry or towed unit may be transported by a specific as-

sociated IFV, APC, truck, or tracked-carrier unit of at least the same size. Furthermore, the transported unit may be *mounted* or *dismounted*.

A POL or supplies target may be transported by a truck or tracked-carrier platoon as *cargo*. Transported cargo must always be mounted.

A scenario may add further restrictions on transported units or cargos and their transports beyond those in this rule.

Basic Rule.

Mounted Units. A mounted unit or mounted cargo is not represented by a separate counter, does not count for stacking, and may not be sighted, identified, or attacked directly. Instead, it is considered to form part of its transport unit. A mounted unit may not attack other ground units or aircraft, may not launch missiles, and may not act as a FAC.

If a transport unit is sighted, no information is given on its mounted unit or cargo.

If a transport unit is identified, any towed mounted unit is also identified (e.g., “the truck platoon is towing artillery” or “the truck platoon is towing a ZPU-4 battery”), otherwise no information is given on its transported unit or cargo.

If a transport unit suffers damage, then its mounted unit or cargo suffers the same damage.

Dismounted Units. At the start of a game, a dismounted unit may be placed according to either its mobility or that of its transport. Otherwise, a dismounted unit and its transport are treated normally. A dismounted unit and its transport need not occupy the same hex.

Advanced Rule.

Mounting and Dismounting Infantry. A dismounted infantry unit in the same hex as its specific associated transport may begin to mount by declaring its intention at the start of a Ground Unit Interaction Phase. At the start of the Ground Unit Interaction Phase five game turns later, the unit is considered to be mounted, and its counter is removed from the map.

A mounted infantry unit may begin to dismount by declaring its intention at the start of a Ground Unit Interaction Phase. At the start of the Ground Unit Interaction Phase two game turns later, the unit is considered to be dismounted, and its counter is placed on the map in the same hex as its transport. If placing the counter would violate stacking requirements, the mounted unit must abort the dismounting process.

During these processes, the transported unit may not perform any other action and the transport may not move and may not carry out ground attacks, but may perform barrage fire if it has this capability.

The transported unit may abort the process at the end of any Ground Unit Interaction Phase.

Mounting and Dismounting Towed Units. A towed unit may not mount or dismount during the game.

Composite and Attached Units

Advanced Rule.

Composite Platoons. At the start of a game, an infantry, infantry weapons, or infantry HQ platoon may *attach* one or two infantry squads to form a *composite* platoon. The *attached* squads are commonly infantry SAM or FAC squads. A scenario may add further restrictions on forming composite platoons.

A composite platoon has the same damage resilience, defense strength, target class, mobility, and sighting range as its constituent platoon.

Once formed, a composite platoon may not be split into its constituent units.

Attached Squads. An attached squad is not represented by a separate counter, does not count for stacking, and may not be attacked directly. Instead, it is considered to form part of its composite platoon. An attached squad retains its normal capabilities (i.e., an attached SAM squad may engage aircraft and an attached FAC squad may sight and mark targets).

If a composite platoon is suppressed, each attached squad is suppressed too. If a composite platoon suffers damage, then for each D of damage, roll one die for each attached squad and on a 3– the attached squad is killed. If a composite platoon is killed, each attached squad is killed too. VPs are awarded for damage to any of the constituent units.
